Коваленко Алексей Викторович, ИУ5-25M

3 вариант

Т

```
In [1]: import pandas as pd
import seaborn as sns
import matplotlib.pyplot as plt
import numpy as np

In [2]: file_path = "src/cars.csv"
data = pd.read_csv(file_path)
```

Описание набора данных

- Источник
- Набор данных состоит из 1 файла cars.csv.
- Данный набор содержит информацию о подержанных и новых автомобилях, выставленных на продажу в США. Данные были собраны с аукционного сайта AUCTION EXPORT.com и включают сведения о 28 автомобильных брендах. Для каждого автомобиля в наборе представлено 12 характеристик, таких как цена, пробег, год выпуска и техническое состояние. Набор позволяет анализировать рынок автомобилей, сравнивать стоимость марок и моделей, а также изучать зависимость цены от параметров вроде пробега или региона продажи.
- **Price** Integer The sale price of the vehicle in the ad
- Years Integer The vehicle registration year
- Brand String The brand of car
- Model String model of the vehicle
- Color String Color of the vehicle
- **State/City** String The location in which the car is being available for purchase
- **Mileage** Float miles traveled by vehicle
- **Vin** String The vehicle identification number is a collection of 17 characters (digits and capital letters)
- **Title Status** String This feature included binary classification, which are clean title vehicles and salvage insurance
- **Lot** Integer A lot number is an identification number assigned to a particular quantity or lot of material from a single manufacturer. For cars, a lot number is combined with a serial number to form the Vehicle Identification Number.
- Condition String Time

ЗАДАНИЕ 1

Задача №3. Для набора данных проведите кодирование одного (произвольного) категориального признака с использованием метода "weight of evidence (WoE) encoding".

```
In [9]: woe_table = data.groupby('brand')['status_b'].agg(['count', 'sum'])
    woe_table.columns = ['total', 'good'] # 'sum' = κοπυνεσπβο Good (1)
    woe_table['bad'] = woe_table['total'] - woe_table['good'] # κοπυνεσπβο Bad (0)

    total_good = woe_table['good'].sum()
    total_bad = woe_table['bad'].sum()

    woe_table['woe'] = np.log(
        (woe_table['good'] / total_good) / (woe_table['bad'] / total_bad)
)

    data['brand_woe'] = data['brand'].map(woe_table['woe'])
```
